

Manufacturer: Wipro Consumer Care

Customer: D-Mart

Products: Santoor, Chandrika, Giffy

Market: Karnataka / Bengaluru

1. Assortment

Definition: An Assortment is a collection of products/SKUs that are planned or authorized to be sold for a particular customer, store, channel, or market.

Purpose: To define which products should be available where.

Why used: A manufacturer may have thousands of SKUs, but every retailer should not necessarily carry every SKU. Assortments help control the relevant product range.

Salesforce example:

Assortment:

D-Mart Karnataka – Personal Care

Products:

Santoor Soap 100g

Santoor Soap 125g

Chandrika Soap 125g

Use case: A field sales rep visits D-Mart Whitefield. CG Cloud knows these three SKUs are expected there. If Santoor 125g is missing, the rep can identify a distribution/out-of-stock opportunity.

2. Multi Copy and Mass Copy

Multi Copy

Definition: Multi Copy allows selected information/configuration to be copied from a source to **multiple selected targets**.

Purpose: Avoid repetitive manual configuration.

Why used: Several stores/accounts may require similar planning or configuration.

Example:

Source:

D-Mart Whitefield

Copy configuration to:

→ D-Mart Electronic City

→ D-Mart Yelahanka

→ D-Mart Bannerghatta

Use case: A Bengaluru Modern Trade setup is already configured for one store and needs to be reused for several selected stores.

Mass Copy

Definition: Mass Copy supports copying/planning information across a **larger set of records in bulk**.

Purpose: Large-scale business configuration.

Why used: Manually maintaining hundreds of customer/product combinations is inefficient.

Example:

Diwali Promotion Template

Mass Copy

500 eligible Karnataka stores

Easy difference:

Multi Copy = One → several selected records

Mass Copy = One → many records at scale

3. Conditions

Definition: Conditions represent commercial terms associated with a promotion/tactic, such as discounts, promotional prices, rebates, allowances, or other benefits.

Purpose: Define **what commercial benefit applies**.

Example:

Promotion: Diwali Promotion

Product: Santoor 100g

Condition: 10% Discount

Period: 1–15 November

Use case: Wipro Consumer Care gives D-Mart a 10% promotional discount on selected Santoor SKUs.

4. Tactic Condition Creation Definition — TCCD

Definition: TCCD defines/configures how conditions should be created in relation to a tactic.

Think of it as the **blueprint or definition** behind condition creation.

Purpose: Standardize condition generation.

Why used: Instead of manually defining the condition behavior every time, TPM can use predefined condition-creation logic.

Example:

Tactic:

Festival Discount

TCCD:

Percentage Discount Condition

Condition concept:

Discount = Percentage

Use case: Every time the relevant promotional tactic is used, the required product conditions can be generated according to the configured definition.

5. Tactic Product Condition — TPC

Definition: TPC represents the product-related condition associated with a tactic.

Purpose: Connect promotional conditions to the applicable products/SKUs.

Example:

Tactic: Festival Discount

Santoor 100g → 10%

Santoor 125g → 12%

Chandrika 125g → 8%

Use case: Different SKUs participating in the same promotion receive different promotional conditions.

TCCD vs TPC

TCCD

"How should the condition be created?"

↓

TPC

"What condition applies to this product?"

6. BO API Transaction Log and Related Objects

BO = Business Object.

Definition: BO API Transaction Log provides tracking information for Business Object API processing/integration transactions.

Purpose: Integration **monitoring, traceability and troubleshooting.**

Why used: CG Cloud commonly exchanges master/transactional information with ERP and other enterprise systems.

Example architecture:

SAP S/4HANA

Business Object API

Salesforce CG Cloud

Suppose SAP sends:

Product : Santoor 100g

Code : SAN100

Sales Org: WCC-IN

A successful transaction conceptually appears as:

Transaction : TX10001

Object : Product

Operation : Create/Update

Status : Success

A failed transaction could show:

Status : Failed

Reason : Sales Organization not found

Use case: An administrator notices that products sent by ERP haven't appeared in CG Cloud. The transaction information helps investigate the failed integration.

Related objects can provide additional processing/business-object information depending on the API and implementation.

7. KPIs

KPI = Key Performance Indicator.

Definition: A measurable value used to evaluate business or execution performance.

Purpose: Convert operational data into measurable performance indicators.

Common KPI categories

KPI Category	Example
Sales	Revenue, Sales Growth
Visit	Visit Compliance
Retail Execution	Shelf Availability
Inventory	Out-of-Stock %
Promotion	Promotion Performance
Merchandising	Display Compliance

Example

Sales rep visits 20 stores but completes 18:

Visit Compliance

= Completed Visits / Planned Visits $\times$ 100

= 18 / 20 $\times$ 100

= 90%

Shelf example:

Expected SKUs = 100

Available SKUs = 95

Shelf Availability = 95%

Use case: Regional manager wants to identify stores with poor product availability.

8. KPI Calculations

Definition: Calculation logic converts source business data into KPI values.

Purpose: Produce consistent measurable results.

Examples:

Sales Achievement

= Actual Sales / Target Sales × 100

Out-of-Stock %

= Missing Products / Expected Products × 100

Promotion ROI

= Promotion Return / Promotion Cost × 100

Use case: Actual sales are ₹9 lakh against a ₹10 lakh target.

Achievement = 90%

Management can immediately see that the account is below target.

9. Data Flow from One Template to Another

This is about how configured structures/templates and underlying business data feed subsequent processing and calculations.

Conceptually:

Master Data

Account / Product

Planning / Templates

Execution

Captured Data

Calculations

KPIs

Reporting

Retail execution example:

Assortment

Store

Visit

Product Check

Captured Availability

KPI Calculation

Manager Reporting

Purpose: Reuse structured configuration and ensure consistent processing.

Use case: Store execution information captured by a representative becomes input for KPI calculations and subsequent management reporting.

10. Sales Organization Object

Definition: Represents the organizational sales structure under which business is conducted.

Purpose: Establish organizational context for customers, products, planning, pricing and TPM processes.

Example:

Wipro Consumer Care

India Sales Organization

Karnataka

D-Mart

Typical information you may encounter includes:

Name

Sales Org Value

Currency

Sales Organization Cluster

Default Price Type

Default Price List Type

Business Unit

Example:

Name : Wipro Consumer Care

Sales Org Value : 0000

Currency : INR

Business Unit : Consumer Care

As you've seen in your CG Cloud org, some fields such as **Sales Org Value/Currency** may be controlled by configuration and not manually editable.

11. Customer Business Plan

Definition: A Customer Business Plan represents the broader commercial plan for managing business with a customer over a planning period.

Purpose: Align manufacturer and customer objectives.

Why used: TPM isn't only about creating individual promotions. Companies need annual/periodic customer-level planning.

Example:

Customer: D-Mart

Year: FY2026

Sales Target : ₹100 Cr

Growth Target : 12%

Promotion Budget : ₹5 Cr

Focus Brands : Santoor, Chandrika

Use case: Wipro Consumer Care plans its FY2026 business strategy with D-Mart.

12. Account Plan

Definition: An Account Plan represents planning information for an account within a defined business/planning context.

Purpose: Translate customer strategy into actionable account-level planning.

Example:

D-Mart FY2026 Account Plan

Sales Target ₹100 Cr

Trade Spend ₹5 Cr

Promotions 12

Expected Growth 12%

Use case: Key Account Manager plans D-Mart's annual sales and promotional activities.

13. Sub-Accounts

Definition: Lower-level accounts within a customer/account hierarchy.

Example:

D-Mart

|

|— Karnataka

|

|— Bengaluru

|

|— Mysuru

|

|— Maharashtra

|

|— Telangana

Purpose: Support granular planning.

Use case: A national promotion applies to D-Mart broadly, while an **Ugadi promotion** may apply only to Karnataka accounts.

14. RTR Reports — Real-Time Reporting

Definition: RTR provides reporting/analysis over available CG Cloud/TPM business information for operational decision-making.

Purpose: Give business users timely visibility into planning and performance information.

Example business questions:

Which customer has highest promotional spend?

Which promotion is underperforming?

Which product category is growing?

How is D-Mart performing against plan?

Use case: National Sales Manager wants current visibility into customer plans and promotion performance.

15. Batch Run Status

Definition: Provides the overall execution status of a background/batch processing job.

Purpose: Monitor large asynchronous processes.

Example:

Batch #BR1001

Process : Promotion Calculation

Status : Running

Later:

Status : Completed

or:

Status : Failed

Use case: Administrator runs a large TPM calculation and checks whether processing completed successfully.

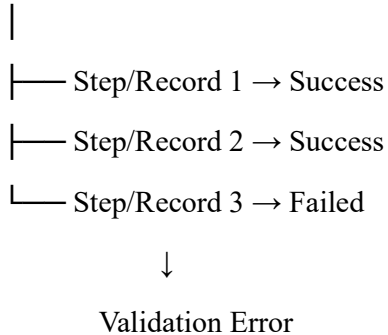

16. Batch Run Status Details

Definition: Provides more granular information related to a particular batch execution.

Purpose: Troubleshooting.

Example:

Batch BR1001

Use case: Overall batch says **Completed with Errors**. The administrator examines details to identify which processing step/record caused the issue.

Remember:

Batch Run Status = **What happened overall?**

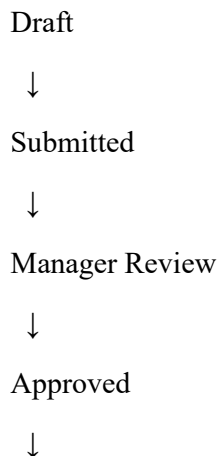

Batch Run Status Details = **Where/why did something happen?**

17. Workflow

Definition: Workflow defines the controlled lifecycle/business process through which a business object moves.

Purpose: Governance and approval control.

Example for a promotion:

Active

Completed

Use case: A Key Account Manager creates a ₹50 lakh promotion. It must receive management approval before execution.

18. Workflow State Transitions

Definition: Defines which movements between workflow states are permitted and the action that causes the movement.

Example:

Current	Action	Next
Draft	Submit	Submitted
Submitted	Approve	Approved
Submitted	Reject	Rejected
Rejected	Rework	Draft
Approved	Activate	Active

Purpose: Prevent unauthorized or invalid lifecycle changes.

For example:

Draft

↓ Submit

Submitted

↓ Approve

Approved

The user shouldn't simply jump:

Draft —————→ Completed

unless that transition is allowed.

19. Product Hierarchy

Definition: Organizes products into multiple levels according to the company's product structure.

Example:

Consumer Goods

Personal Care

Soap

Santoor

Santoor Sandal

Santoor 100g

Another branch:

Consumer Goods

Home Care

Dishwash

Giffy

Purpose: Planning and analysis at different product levels.

Use case:

Promotion could target:

All Personal Care

or:

All Santoor

or only:

Santoor 100g

20. Account Hierarchy

Definition: Organizes customers/accounts into parent-child business levels.

Example:

D-Mart National

D-Mart South

D-Mart Karnataka

D-Mart Bengaluru

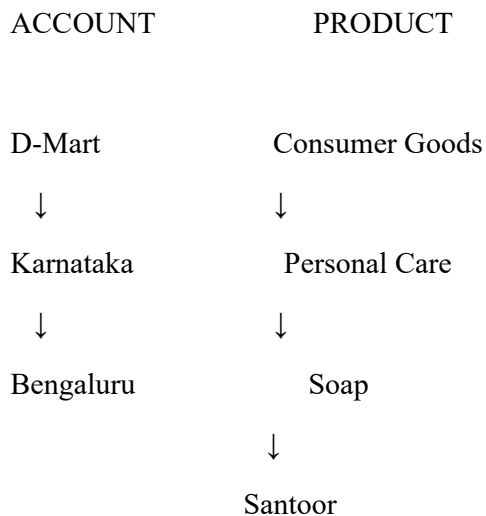

D-Mart Whitefield

Purpose: Allow customer planning at national, regional, local or other configured account levels.

Use case: Diwali promotion could apply nationally while a Karnataka-specific promotion applies only to the Karnataka branch.

Product + Account Hierarchy together

This is extremely important in TPM:

Now TPM can express a business requirement such as:

Give D-Mart Karnataka a 10% promotional discount on Santoor products.

Account hierarchy answers → WHO?

Product hierarchy answers → WHAT?

21. Mobile Configuration

Definition: Configuration determines which supported CG Cloud retail-execution information and activities are available to field users on mobile devices.

Purpose: Enable sales representatives to execute store visits while in the field.

Example activities:

Login

Today's Visits

Open D-Mart Whitefield

Check Assortment

Check Inventory

Perform Survey/Tasks

Capture Execution Data

Complete Visit

Use case: Wipro Sales Rep visits 15 retailers daily and performs retail execution from the mobile solution rather than carrying paper forms.

22. Offline Capability

Definition: Offline capability allows supported mobile activities/data to remain available when the device doesn't have continuous connectivity, subject to the organization's mobile configuration.

Purpose: Field representatives often work in stores or locations with poor connectivity.

Example:

Morning

Internet Available

SYNC

Download required visit data

Sales Rep enters Store

NO INTERNET

Perform supported visit activities

Capture information locally

Internet Available

SYNC

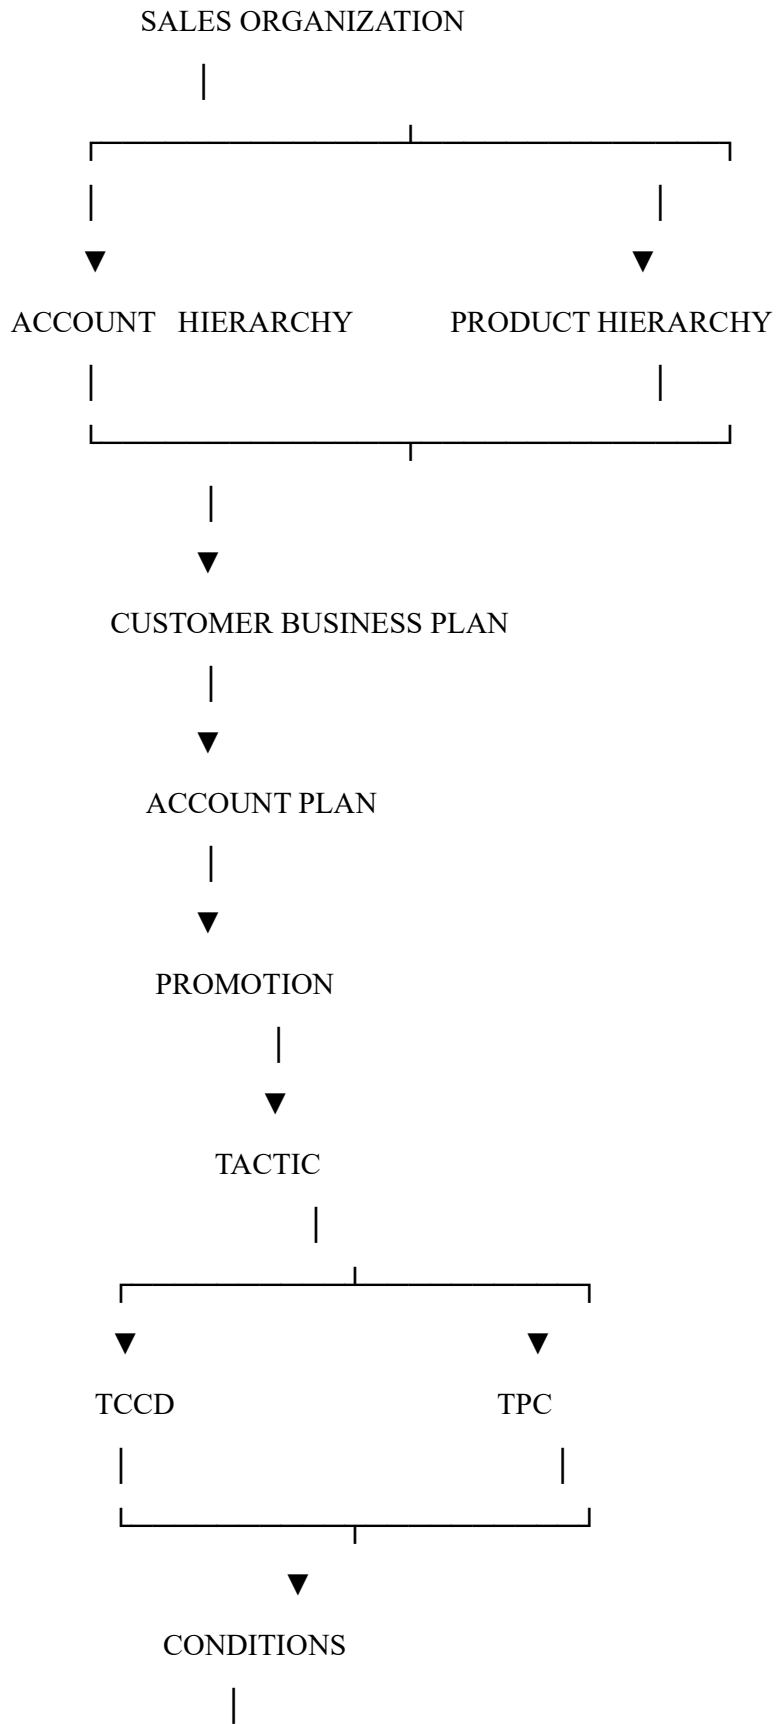

Salesforce CG Cloud

Use case: Sales representative visits a rural distributor with no reliable network. They continue supported visit activities offline and synchronize when connectivity returns.

Complete TPM + CG Cloud Business Flow

For your training, this is the **main diagram I'd put on the board:**

WORKFLOW

Draft → Submitted → Approved

BATCH PROCESSING

Batch Status

Status Details

KPIs

RTR REPORTING

RETAIL EXECUTION

Assortment → Store → Visit → Mobile → Offline/Online

Synchronization
